### **NEW ENERGY DATA LOGGER LAUNCHED BY ELCOMPONENT ELIMINATES CONNECTION ERRORS**

The instrument has been developed from the highly successful SP MAX and maintains its popular 'safe connection' feature for monitoring 3-phase systems but, in addition, also offers a full 3-phase voltage connection option. Developed around an entirely new microprocessor, the Energy Pro uses a plug-in 32MB flash card which provides a huge memory capacity and fast and easy download of stored data together with a new PC software package with improved data analysis and graphical presentation facilities.

The most revolutionary feature of this new product is the user interface and 'auto-correct' capability. The on-board LCD screen uses simple icons and keywords to guide the user through the set up and is easily grasped by non-technical operators. More importantly, the traditional difficulties with connecting to 3-phase electricity supplies (phase rotation, current and voltage matching, clamp orientation etc) are completely removed. Regardless of how the current and voltage connections are actually made the instrument corrects any errors in software to guarantee meaningful results every time.
